To Whom it May Concern:

Re: Letter of recommendation to grant Immigration to Dr. Zhongyan Lin under the Category of Professionals with Extraordinary Ability

This letter is written to support the application of Zhongyan Lin for immigration to the United States under a special category of professionals with extraordinary ability or outstanding researcher. I hold the Unidel Chair for Mathematics and Computer Science at the University of Delaware. I am the author of over 200 research papers, and the author of 6 research monographs. I am Editor-in-Chief of the two mathematics journals APPLICABLE ANALYSIS and COMPLEX ANALYSIS; moreover, I am on the editorial boards of 12 other research journals. I first met Lin when I was visiting China. He impressed me at that time with his sharp mind and we started a joint collaboration on a paper during my visit. I was so impressed with him that I recruited him right away to come and finish his Ph. D. with me at Delaware. He had participated in several important mathematical research and engineering design projects in China and had written several very good papers in that field before coming to work with me. We wrote one paper together on inverse problems before I started him on computational acoustics. Dr. Lin wrote an brilliant Ph. D. thesis under my direction on computational acoustics and inverse problems for mathematical physics. Dr. Lin and I collaborated subsequently on numerous research efforts and published jointly eight papers. Dr. Lin's research was mainly concerned with computational acoustics for shallow ocean with an interactive seabed, and the undetermined coefficient problems for partial differential equations. These are ill-posed problems, and very difficult. He is working in areas that are very important to industry and national security. The direct application of his work is for the detection of mines that might be placed in a harbor. The same technology developed in his research is of use in determining the nature of the sea-bed, which can be used in the many areas such as prospecting for off-shore petroleum and gas, and constructing drilling platforms. His research, which is related to non-destructive evaluation (NDE), has numerous commercial, defense, and health applications. For

example, non-destructive evaluation is being used to evaluate aged aircraft in the Air Force, and inverse scattering is of potential use in medical diagnoses. Lin has accomplished an immense amount in the area of computational acoustics. He is a great problem solver, in particular, in the area of partial differential equations involving inhomogeneous media and non-constant coefficients. This is because he has a solid and extensive training in mathematics, physics and computer science. He specializes in both theoretic approaches and numerical methods. He can design and implement the most efficient algorithms for many challenging problems. Because of his excellent work, now we have several effective ways for computing the acoustic field in a shallow ocean. This includes various types of sea-beds, with various sound sources, and also with objects embedded in the sea-bed. His research in this field has components which vary from abstract mathematics such as functional analysis to the implementation of these ideas in the terms of very large computer codes. His codes were run on the Cray at Pittsburgh and were very successful for determining unknown objects such as submarines and/or mines. Lin's research is on the cutting edge of modern computational acoustics, and Navy applications of these methods. His code for a full three-dimensional acoustic field generated by scattering an illuminating signal is state of the art. There are few scientists in the world today who have the command not only of an exquisite knowledge of scientific computation but also the command of abstract mathematics to permit a break through in the field of inverse acoustic problems in an ocean environment. Dr. Lin's work in inverse problem is also outstanding. His recent paper "On the determination of radially dependent Lame coefficients" has caught great attention among the researches in this field. This long paper published in SIAM Journal on Appl. Math., one of the best journals in the field, proves a very important theorem in the area of non-destructive evaluation and the method he established has a potential for solving numerous problems in the field. His results is one of best results on inverse problem in recent years. Because Dr. Lin is a very active researcher, he was asked to review submitted papers for publication and international conference many times. Lin also has an advanced degree in Computer Science. His combined knowledge of acoustics, and computer science and information systems make him a great asset to our country for the development of technology and hence also the economy of our nation as a whole. Dr. Lin is an excellent applied mathematician and outstanding researcher. And he is clearly the best Ph.D. student I have had in 40 years of graduate teaching! At this time Dr. Lin is employed in the aeronautic and automatic control industry and his knowledge of inverse problems and acoustics can be easily transferred to identification of objects, collision avoidance, noise control and other automatic control, which of course are of great importance to that industry. It is indeed rare when a researcher such as Zhongyan Lin appears on the scene. Not only is he a highly gifted, and well trained computational-mathematician, he has, an extraordinary knowledge of mathematical physics. Currently, I am particularly interested in collaborating with him to solve more inverse scattering problems. This efficient solving of this problem is of great importance for National security. There will always be a contest between potential aggressors and the scientist who strive to protect our shores. It is necessary that we keep a monopoly of those scientists here in our country. With this object in mind, I recommend that you give serious attention to considering Dr. Zhongyan Lin for special waiver of Labor Certification. Dr. Lin is an outstanding scientist and is

Subject: Recommendation to grant immigration to Dr. Zhongyan Lin under Professionals with Extraordinary Ability or Outstanding Researchers

To whom it may concern,

I am writing this letter in support of the application of Zhongyan Lin for immigration to the United States under a special category of National Interest Waiver for professionals holding advanced degrees. I am a professor of mathematics at the United States Naval Academy. I am the author of a number of papers in underwater acoustics and the mathematical theory of elasticity as well as a research monograph in partial differential equations and a textbook in numerical analysis.

I became acquainted with Dr. Lin when he was a graduate student of my long term collaborator Dr. R.P. Gilbert of the University of Delaware. I have had occasion to discuss his work on the effect of the composition of the seabed on acoustic transmission in shallow water, a subject of mutual interest. I invited him to the Naval Academy to speak on his work on inverse problems last year. Additionally I have refereed one of his papers for publication.

Dr. Lin's work is first rate. He made significant breakthroughs in the mathematical theory of acoustic transmission over an elastic seabed, in particular discovering an inner product that will permit more rapid calculation of the acoustic field arising from sound scattering off an object in a shallow ocean. This discovery should may also facilitate the extension of current methods for the inverse problem of reconstructing the shape of an object from the sound waves scattered off of it. Solution of such problems in the presence of a seabed are currently of great interest to the Navy since it is anticipated that in the near future many naval conflicts will be conducted in littoral areas.

I am also impressed by his work on other inverse problems such as the determinations of the coefficients of the partial differential equation governing an elastic body from measurements made on it surface. Inverse problems such as Dr. Lin works on are of great importance in numerous fields such as bio-medicine and seismology, as well of course, as underwater acoustics and the underlying mathematical and computational techniques tend to be the same irrespective of the field of application.

I should also mention that Dr. Lin holds a master's degree in computer science as well as a doctorate in mathematics. Almost all problems of importance in applied mathematics have a significant computational component. In my experience the most effective solutions are

obtained by people who have command of both the analytical techniques and the computational algorithms involved in the problem. Unfortunately people with strong backgrounds in both analysis and computation are uncommon. Dr. Lin's proficiency in both makes him a valuable asset.

In summary Dr. Lin possesses valuable and rare skills which are of importance to the United States both militarily and commercially. I strongly support his application for immigrant status under the National Interest Waiver.

Sincerely,

James L. Buchanan

ON THE DETERMINATION OF RADIALLY DEPENDENT LAMÉ COEFFICIENTS*

ZHONGYAN LIN†

Abstract. In this paper, we prove that one can determine radially dependent Lamé coefficients λ and μ of an isotropic elastic ball by choosing only two correspondences in the Dirichlet-to-Neumann map, i.e., twice making measurements of displacement and stress on the surface of the ball. This is a one-dimensional, multiunknown, undetermined coefficient problem for a system of partial differential equations. We use a matrix form of the transmutation mapping for solving this problem. The procedure for proving the uniqueness based on transmutation can be viewed as a computational algorithm. Also the method we develop has the potential of solving other one-dimensional, multiunknown inverse problems.

Key words. inverse problem, elasticity, elliptic system, one dimension, Lamé coefficients, computer algebra, matrix, transmutation, moments, hyperbolic system

1. Introduction to the inverse problem and the main result. The problems of determining the coefficients in partial differential equations are important and interesting inverse problems. The coefficients often describe the physical properties of the region to be detected. Most studies of undetermined coefficient problems involve a single unknown coefficient in a scalar equation such as $u_{tt} = u_{xx} + a(x)u(x)$ or $\mathrm{div}(\gamma(\vec{x}) \bigtriangledown u) = 0$. Recently, inverse problems for systems of equations are being considered. In fact, for many problems in elastic and electromagnetic inhomogeneous media, only by restricting the coefficients do we get a single potential equation. For example, if only one coefficient is variable while others are constant, we can decouple the system of equations; or, on the other hand, when we set some coefficients to be zero, we may get a single acoustic-type equation. Otherwise we have to deal with systems of equations and identify simultaneously multiple coefficients.

Since for radially symmetric objects the inverse problems for a single potential equation have been well studied [12, 17, 6, 4], in this paper we consider an inverse problem for a system of equations with radially dependent coefficients. The problem is to determine the radially dependent Lamé coefficients of an elastic ball by the measurements of stress and displacement taken on the surface. To introduce this problem more precisely, first we quote from [1] the following formulation for the problem of determining variable elastic coefficients by boundary measurements.

Let $\Omega \subset \mathbb{R}^n$ be a domain with smooth boundary $\partial\Omega$ and filled with a linear, inhomogeneous elastic medium. The deformation of Ω due to the given displacement vector $\vec{f} \in C^\infty(\partial\Omega)$ is expressed by the following Dirichlet boundary value problem in terms of displacement vector $\vec{u} = \vec{u}(x)$:

$$L_C\vec{u} = \mathrm{div}\sigma(\vec{u}) = 0, \quad \in \Omega, \tag{1.1}$$

$$\vec{u}\big|_{\partial\Omega} = \vec{f}, \tag{1.2}$$

AI 摘要

SIAM Journal on Applied Mathematics (SIAP) is a highly respected and influential journal within the field of applied mathematics. It is widely considered one of the top journals in its area and is known for publishing high-quality research that bridges the gap between mathematical theory and practical applications across various scientific and engineering disciplines.

Here's why SIAP is considered a strong journal:

High Impact:

It consistently ranks well in journal rankings and receives a high number of citations, indicating its influence on the field.

Interdisciplinary Focus:

SIAP publishes research that applies mathematical methods to diverse fields like physics, engineering, finance, and biology, making it a valuable resource for researchers across many disciplines.

Strong Reputation:

It is recognized as one of the leading journals in applied mathematics and is part of the prestigious SIAM journal family.

Rigorous Standards:

SIAP maintains high standards for both the mathematical rigor and the practical relevance of the research it publishes.

Global Reach:

SIAM journals, including SIAP, have a strong international presence and play a key role in connecting researchers worldwide.

Unique Publishing Opportunity:

SIAP provides a space for researchers to publish work that integrates both the mathematical and applied aspects of a problem, which can be challenging to achieve in more specialized disciplinary or pure mathematics journals.

In summary, SIAM Journal on Applied Mathematics is a top-tier journal that is highly regarded for its quality, impact, and interdisciplinary focus within the field of applied mathematics.

Re: Recommendation Letter for Dr. **Zhongyan Lin**

Dear faculty searching committee:

It is my pleasure to recommend Dr. Zhongyan Lin for the faculty position that is available at your institution in the field of computer information science and data analytics.

I worked with Dr. Lin for 16 years at Delaware State University (DSU) before I joined my current company in 2018. I know Dr. Lin very well. He is a very friendly person, who works very hard in teaching, research and software development. For many years, he taught the most course sessions and most students in the department of computer and information sciences at DSU.

From his fully-verified publication list (https://zhongyanlin.github.io/site/publication), we can see that he had done decent research work in the field of partial differential equation and inverse problems, published papers in some of most prestigious journals such as SIAM J. Applied Math.

I worked with Dr. Lin on a project of data analytics titled "Correlation of Risk of Breast Cancer with density of breast density" funded by Army research office and Medical School of University of Pennsylvania for a period of three years . We together processed 1.5 Terabytes of clinical data, including image data, text information and numerical data. We performed analysis and completed reports for the submission to the funding agencies. Dr. Lin wrote programs, created and maintained an online database and produced all queries to generate reports.

Before this project, Dr. Lin also worked on another data analytics project funded by Army research lab in 2008. That project was about statistical modeling (the application of maximum likelihood method to determine critical penetration distance in armor).

Dr. Lin has been an early proponent of utilizing computer technology for class management, students' grading and computer-assisted education. As such, he preceded for years the current trends in on-line and hybrid learning. From his annotated list of software of public interests that he developed (https://zhongyanlin.github.io/site/), we can see that he recently published three apps in the google play store on teaching technologies and data analytics using artificial intelligence. They are:

- Grading Scanner: https://play.google.com/store/apps/details?id=com.systemsonweb.grading,
- Enquire-response: https://play.google.com/store/apps/details?id=com.systemsonweb.response,
- Facial attendance: https://play.google.com/store/apps/details?id=com.systemsonweb.attendance.

I strongly believe that Dr. Lin's background in both computer and information science and mathematics makes him an excellent candidate for teaching position in the field of computer information science or data analytics.

Sincerely,

David Donald Pokrajac, Ph.D.

Letter of Invitation

February 15, 2025

Dr. ZHONGYAN LIN
Delaware State University (DSU)
Delaware, DE 19904

Dear Dr. ZHONGYAN LIN:

We are very pleased to invite you to Ningbo University of Technology as a short term visiting scholar in the DSU-NBUT Joint Information and Computing Science Program from February 15, 2025 to June 27, 2025.
Please take your flight to Ningbo and we will pick you up at Ningbo airport. We'll provide accommodation for you, and we understand that others will be at your own expense.

We are delighted that you will be coming to join us for this period of time. Please let us know if there is anything else we may do to be of assistant to you.

This invitation is specifically extended to the person below:

Full Name	Gender	Date of Birth	Passport number	Date of Issue	Date of Expiry
ZHONGYAN LIN	Male	December 12, 1963	546353345	November 14, 2016	November 13, 2026

We are looking forward to meeting you at Ningbo.

Sincerely yours,

Prof. Xu Jiaqing

Dean of International Exchange College
Ningbo University of Technology
